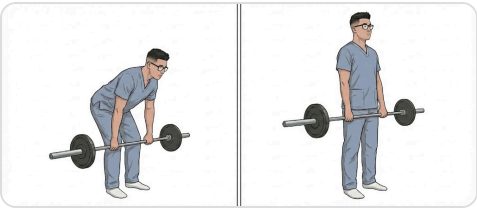
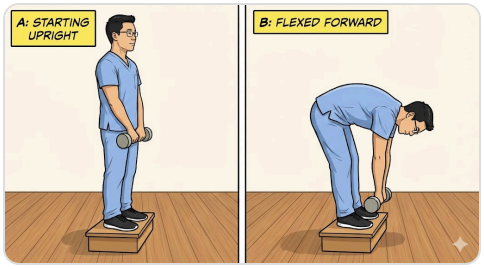
HOME EXERCISE PROGRAM

Personalized Recovery Plan



REVERSE DEADLIFT

Starting position: Stand with your feet shoulder width apart. Grip the barbell or a pair of dumbbells in front of you with an overhand grip. Then begin to initiate the hip hinge: slowly push your hips back, slightly bend your knees and keep the bar close to your legs. Then slowly lower the bar/dumbbell towards your shins while keeping your back flat and chest up. Return to the starting position by slowly driving your hips forward to the starting position by squeezing your glutes. Avoid straightening your knees, arching your back, or swinging the weight- if you are the weight is likely too heavy. Repeat 10 reps x 3 sets.



JEFFERSON CURLS

Starting position: Stand on a raised platform (low box or weight plate). Keep your feet shoulder width apart. Grip your dumbbells with a overhand grip. Start the curl by tucking in your chin and curling your spine bit-by-bit until your arms are slightly past your toes. Return slowly to the starting position by engaging your core and squeezing your glutes. Do not use momentum or speed in this exercise. Repeat for 10 reps x 3 sets. If you cannot perform this exercise slowly then the weight may be too much for you.

BIRD DOG ON BOSU BALL

Start with holding your right hand and straightening your elbow on a Bosu Ball and lifting your right leg and left arm. Maintain two points of contact with left toes and right elbow straight. Then slowly return to the starting position. Repeat 10 reps x 3 sets. Switch the bosu to the other arm after each set.

These exercises are intended to be the most basic and equipment-free exercises to help current movement dysfunction, please try to perform daily and consult a physician if the exercise worsens your pain and function significantly.
