HOME EXERCISE PROGRAM

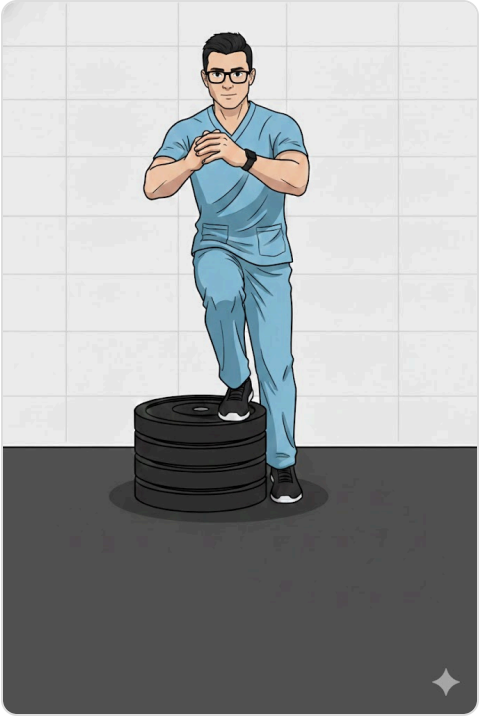
Personalized Recovery Plan

SINGLE LEG DECLINE SQUAT

Start by standing on a weight or sturdy object to elevat your heel on your injured leg. Then lift your uninjured leg forward so you are standing on your injured leg. Slowly squat down to no more than 60 degrees and without pain before returning to the start position. If you can do 10 reps x 3 sets without any significant balance issues or pain you can progress by adding weight or increasing the elevation of your heel. Repeat 10 reps x 3 sets.

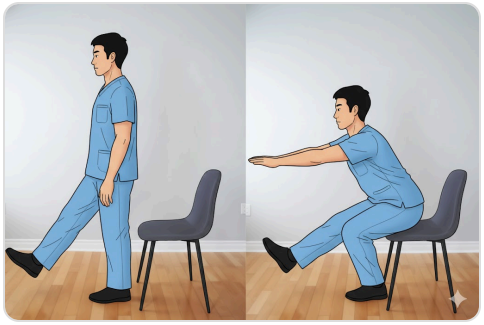
SINGLE LEG HALF REVERSE DEADLIFT

Start standing on both feet, straighten your elbows with the weight and lift one leg off the ground. Bend your waist forward while maintaining your straightened elbows with the weight and leg. Hold for 3s before returning back to both feet. Repeat this 10 reps x 3 sets. Switch legs after each set.



SIDE STANDING SINGLE LEG SQUAT

Start by having both legs on a pile of weights or a sturdy bench. Then move your body closer to the edge and lower one leg down to the ground before standing back up and having both legs on the bench again. Perform this task slowly while minimizing the amount of hip and knee movement. Switch legs. Repeat 10 reps x 3 sets.



SINGLE LEG SQUAT ON CHAIR

Start by standing on one leg and lifting the other leg forward. Ensure there is a sturdy chair behind you against a wall. Slowly sit down on the chair and stick your glutes back while keeping your knee straight. Once you have taken a seat, slowly rise up again. Repeat this 10 reps x 3 sets. Switch legs after each set.

These exercises are intended to be the most basic and equipment-free exercises to help current movement dysfunction, please try to perform daily and consult a physician if the exercise worsens your pain and function significantly.
