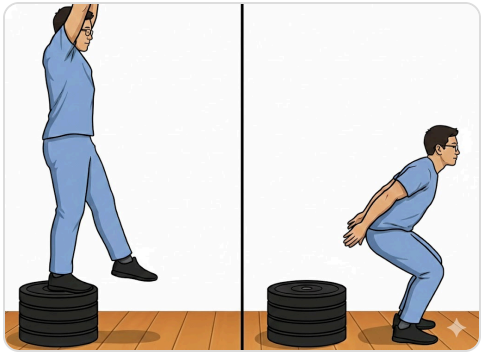
HOME EXERCISE PROGRAM

Personalized Recovery Plan

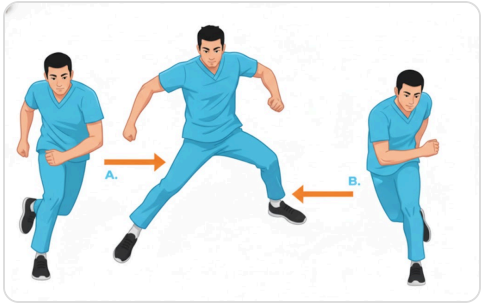
SINGLE LEG DECLINE SQUAT

Start by standing on a weight or sturdy object to elevat your heel on your injured leg. Then lift your uninjured leg forward so you are standing on your injured leg. Slowly squat down to no more than 60 degrees and without pain before returning to the start position. If you can do 10 reps x 3 sets without any significant balance issues or pain you can progress by adding weight or increasing the elevation of your heel. Repeat 10 reps x 3 sets.



SINGLE LEG DROP

Start by having both legs on a pile of weights or a sturdy bench. Stick on leg out and then land on two feet gently. Avoid landing on stiff legs and have both knees bent. Repeat 10 reps x 3 sets.



LATERAL BOUNDING

Start by bending your right knee around 45 degrees and tuck your left leg slightly behind your right. Propel yourself towards the right and land on your left leg. Then begin bounding on your left by bending your left knee.

These exercises are intended to be the most basic and equipment-free exercises to help current movement dysfunction, please try to perform daily and consult a physician if the exercise worsens your pain and function significantly.
