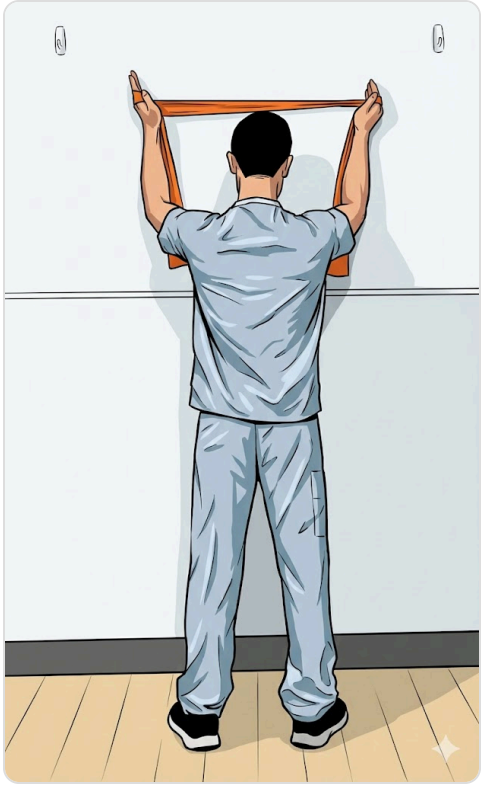
HOME EXERCISE PROGRAM

Personalized Recovery Plan

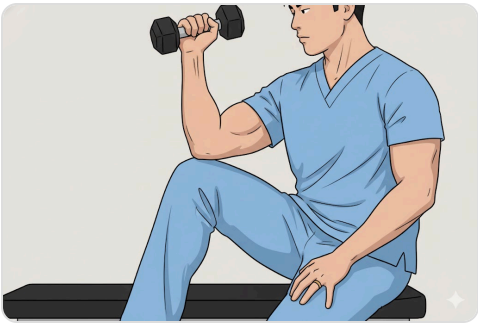
SHOULDER ABDUCTION AND EXTERNAL ROTATION WITH BAND

Start by holding both ends of the exercise band the left side of your waist. Then with your right arm pull the exercise band away from the waist in a diagonal manner while rotating the shoulder outward and having the elbow bent at 90 degrees. Hold this contraction for 3s before slowly returning to the starting position. Ensure to work both sides and to not push past the point of pain. Repeat for 10 reps x 3 sets.



BANDED SCAPULAR ROTATIONS AGAINST WALL

Stand facing against the wall and have your elbows and forearms against the wall, pull the exercise band apart so your arms are in a slight Y position. Squeeze your shoulder blades then slide your elbows and forearms up until your elbows are near the level of your face and then slowly slide it back down to the starting position while maintaining tension in the band. Ensure there is no pain during this movement. Repeat 10 reps x 3 sets.



DUMBBELL INTERNAL/EXTERNAL ROTATION

Starting position: rest your elbow of your injured shoulder your knee. Bend your elbow at 90 degrees while holding the dumbbell. Then slowly bring the held dumbbell towards the center of your body letting the shoulder rotate internally while your elbow is resting on your knee. Then slowly bring the held dumbbell back to the starting position by rotating the shoulder externally. If you cannot perform this movement slowly the weight is too heavy and move to a lighter weight. Repeat this 10 reps x 3 sets.

These exercises are intended to be the most basic and equipment-free exercises to help current movement dysfunction, please try to perform daily and consult a physician if the exercise worsens your pain and function significantly.
